Many rivers in the Carolinas are approaching record flood stages, and officials say their levels will continue to rise through the week. Sean Rayford/Getty Images

Hurricane Florence has broken rainfall records since it made landfall late last week, dumping more than 35 inches of rain in some areas of North Carolina.

Since hurricanes are classified by wind speed, Florence's downgrade to a tropical storm after it reached land didn't mean any relief from devastating amounts of rain that caused rivers in the Carolinas to spill over into nearby communities.

State, weather, and military officials, as well as news organizations, have used aircraft to capture images to monitor the storm's damage. Take a look at the water that officials say is still rising.

**As the storm moved on but flooding continued, the National Oceanic and Atmospheric Administration used remote-sensing cameras on an aircraft to capture a series of images of the storm's damage.**

A team of NOAA aviators and sensor operators captured the images using specialized remote-sensing cameras aboard NOAA's King Air aircraft flying above the area at an altitude of 1,600 to 5,000 feet.
