

China flooding leaves thousands trapped after levees fail, another dam at risk of breaking

At least 141 people have died or are missing in flooding since the beginning of June

More than 10,000 people are trapped in a town in eastern China as flooding across much of the country renews pressure on dams.

The provincial government in Anhui province said online that on Sunday floodwaters breached levees protecting the town of Guzen and left area residents trapped.

Wang Qingjun, Guzen's Communist Party secretary, told the official Xinhua News Agency that floodwater rose as high as 10 feet in the region.

CHINA FLOODING DEATH TOLL RISES AS SURGING WATERS TRIGGER NEW ALERTS, DAM BLASTED

State media outlets reported that around 1,500 firefighters rushed to rescue those in the province, where weeks of heavy rain have disrupted the lives of more than 3 million people.

In central China's Hubei Province, local governments urged residents to prepare for evacuations due to a growing risk of dams that may break.

The Enshi Tujia and Miao Autonomous Prefecture government said a landslide along the Qingjiang River increased the threat of dam failure there, according to the Global Times.

China's Meteorological Administration warned that more heavy rain along the Yellow River and Huai River is expected over the next three days.

In Jiangxi province, 45-year-old Xu Yongxiang told China Youth Daily his village of Liufang had been without running water or electricity for almost a week.

"We do not have 1 inch of dry ground. It has all been flooded," he said online.

DEVASTATING CHINA FLOODING PUTS CONTROVERSIAL THREE GORGES DAM UNDER NEW SCRUTINY

Last week, the controversial Three Gorges Dam on the Yangtze opened three floodgates as the water level behind the massive dam rose more than 50 feet above flood level.

Additional rainfall is putting renewed pressure on the dam, which straddles the mighty Yangtze River.

The official Xinhua News Agency said the rate of flow in the reservoir behind the dam would hit a record for the year Friday night, at 55,000 cubic meters (almost 600,000 cubic feet) per second.

The inflow peaked Saturday at 61,000 cubic meters per second, before easing to 46,000 by Sunday night, Xinhua reported.

State media outlets have insisted that the massive dam is stable amid the flooding and that its operations are "safe and sound," the Global Times reported.

"The Three Gorges Project is not so 'fragile' as some people have imagined... it has prevented large floods," the dam's operator, China Three Gorges Corp. (CTG), told the Global Times. "Speculation without scientific monitoring data is irresponsible and unprofessional, or out of ulterior motives!"

On Sunday, a dam in Anhui was blasted to allow floodwaters to flow downriver. The province's Wangjiaba dam on the Huai River opened its 13 sluice gates on Monday, flooding cropland and forests to prevent more extensive damage downriver.

Seasonal flooding strikes large parts of China each year, especially in its central and southern regions, but conditions this year have been especially bad due to heavy rainfall.

China experienced its worst flooding in recent years in 1998 when more than 2,000 people died and almost 3 million homes were destroyed, mostly along the Yangtze.

The Associated Press contributed to this report.
