

Guatemala volcano eruption: Aerial DRONE pictures capture Fuego's deadly eruption

DRONE camera images taken over the Volcano de Fuego in Guatemala have been revealed following its dramatic eruption that caused widespread chaos and devastation.

The drone camera captured dramatic images of the volcano, which has been rocked by strong eruptions. Brown and grey marks can be seen on one side of the mountain caused by the lahars flowing down from the crater.

The footage was recorded on 10th June, a week after the eruption of the volcano de Fuego, which left surrounding villages covered in molten ash and killed at least 110 people.

A column of smoke can be seen billowing out of the crater.

The drone video comes on the heels of warnings of worrying activity from nearby Volcano Pacaya, 20km (12 miles) from the capital Guatemala City.
