# Track the Coronavirus with this interactive map

Researchers at Johns Hopkins University have created a live map and dashboard to help you track the global spread of the Coronavirus.

The map updates data daily in real-time from the World Health Organization and the Centers for Disease Control and Prevention in the U.S., China, Europe, and other countries.

Click here to check it out. Here is a new coronavirus stat website to track the disease. Very detailed. Click here

China has counted 170 deaths from a new virus and more countries have reported infections, including some spread locally, as foreign evacuees from China's worst-

hit region returned home.

India and the Philippines reported their first cases in people who had been in the Chinese city where the new coronavirus first surfaced. South Korea confirmed a case that was locally spread, in a man who had contact with a patient diagnosed earlier. Locally spread cases outside China have been a worrying concern among global health officials. The World Health Organization is reconvening experts on Thursday to assess whether the outbreak should be declared a global emergency.
